- (54) BLOOM FILTER FOR SERVICE HINT INFORMATION IN ADVERTISEMENTS
- (57) Certain aspects of the present disclosure generally relate to using bloom filter hash functions for service hint information in advertisements such as beacons and probe responses. Certain aspects provide an apparatus for wireless communications, such as an access point (AP). The apparatus generally includes a processing system configured to generate a plurality of bitmaps that indicate one or more services known by the apparatus, each bitmap being generated by applying a different set of one or more cyclic redundancy check (CRC) based hash functions to one or more service identifications (IDs) of each service, and to generate one or more frames, each frame including one of the plurality of bitmaps and an indication of the set of one or more CRC based hash functions used to generate the bitmap included in the frame, and an interface configured to output the one or more frames for transmission.

- (54) CHANNEL ESTIMATION ENHANCEMENTS
- (57) The disclosure relates in some aspects to techniques for improved channel estimation. For example, a device can specify a pilot structure where pilot density differs over time. As another example, a device can indicate that a pilot from a prior transmission time interval (TTI) can be used for channel estimation. As another example, a device can employ frequency domain physical resource block (PRB) bundling with the bundling information signaling. As yet another example, a device can use an adjustable traffic-to-pilot ratio (TPR) for throughput optimization. Other aspects, embodiments, and features are also discussed and claimed.

- (54) Process For Recovering Value Metals From Ore
- (57) This invention relates to a process for recovering valuable metals from ore with significantly reduced water consumption through the discrete treatment and storage of coarse tailings. Ore is ground to produce a coarse particulate ore. The coarse particulate ore is treated in a coarse flotation stage to produce a low grade concentrate fraction and a coarse tailings fraction. The low grade concentrate fraction is treated to produce fine tailings and a saleable concentrate. The coarse tailings are treated separately from the fine tailings and water is recovered from the coarse tailings by hydraulically stacking; filtering or screening, whereafter the coarse tailings are dry stacked, without being recombined with the fine tailings.

- (54) Electromagnetic Device
- (57) Disclosed is an electromagnetic device, especially an electromagnetic device which can solve a kinetic energy loss caused by an accreted magnet under a load. The electromagnetic device is mainly composed of a stator and a rotor which can move relative to each other, characterized in that a movement direction of the rotor is parallel to a magnetic line for generating a double magnetic point; and one end facilitating a forward direction of movement in two ends of a magnetizer (21) of an induction coil group (20) serving as the stator or rotor is provided with a magnetic yoke (25) of a larger diameter for using a unilateral magnetic yoke to break an accreted magnetic balance, which can magnify a horizontal vector component force and reduce a dynamic loss rate, so as to improve an energy conversion rate.

- (54) AN ELECTRIC GENERATOR HAVING A CENTRAL MAGNETIC SHAFT
- (57) An electric generator has the stator comprises a central shaft and has at least one axially offset coil at an axial end of the central shaft such that a major central portion of the central shaft is not surrounded by the coil. The stator comprises a plurality of generating layers, each generating layer comprising generating windings radially aligned with the major central portion of the central shaft. A rotor comprises a magnetizing layer arranged co-axially around the first generating layer and radially aligned with the major central portion. The generator has at least one of the generating layers is in the form of a tubular assembly comprising a tubular body which is co-axial with the central shaft and at least one axially-offset coil at an axial end of the tubular body such that a major central portion of the tubular body is not surrounded by the coil.

- (54) METHOD AND SYSTEM FOR WASTE PAPER PURIFICATION
- (57) A method and system for wastepaper purification. The method for waste paper purification comprises: while performing the bulk process on the bundled waste paper, a first dry dust removal process is performed on the scattered waste paper; breaking the scattered waste paper into fragments of waste paper; and a second dry dust removal process is performed on the waste paper fragments. The system for waste paper purification adopts a dry duster (7) and a wet scrubber (8) to remove impurities and dust in the waste paper bag by dry method as much as possible, and then further removes it by a special water washing equipment wet method, which effectively improves the dust removal. At the same time, the ash content of the waste paper bag pulp after process is close to the ash value contained in the original waste paper, thereby simplifying the purification and screening process flow after the pulping of the waste paper process system.

(54) BALE BREAKING AND DUST REMOVING DEVICE
(57) A bale breaking and dust removing device (1) comprises a roller (10) and at least one rotating shaft (20), wherein the roller (10) comprises a feed opening and a discharge opening. A first cutter part (13) is arranged on the inner wall of the roller (10). At least a part of the rotating shaft (20) is located in the roller (10), and a second cutter part (21) is arranged on the rotating shaft (20). The first cutter part (13) and the second cutter part (21) break baled material when rotating with the roller (10) and the rotating shaft (20) respectively, and further tear the material apart when crossing each other in the roller (10). The bale breaking and dust removing device further removes impurities attached to the material by a dry dust removal method, and thus can simplify a follow-up purification and screening treatment.

- (54) "SCRAP WASHING DEVICE"
- (57) The present disclosure relates to a scrap washing device. The scrap washing device comprises: a washing container for accommodating cleaning fluid and scrap to be washed; and a washing unit for rolling the scrap in the cleaning fluid. The scrap washing device according to the disclosure can further remove contaminants attached to the scrap by wet scrubbing, which can hardly be removed by dry scrubbing, and thereby reduce the contaminants in the scrap and simplify subsequent cleaning and screening process.

- (54) WASTE PAPER SHREDDING COMPONENT AND DEVICE
- (57) Disclosed are a wastepaper shredding component and device. The waste paper shredding component comprises: a knife roller, which is rotatable about its axis; a flying knife (10'), which is mounted on the knife roller and comprises a first blade portion (11'); a knife holder; And a bottom knife (20'), which is mounted on the knife holder. The bottom knife comprises a second blade portion (21') that engages with the first blade portion to cut off wastepaper, and the second blade portion extends in a direction along the axis of the knife roller. The first blade portion (11') is inclined with respect to the second blade portion, such that when the knife roller rotates, the first blade portion can progressively engage with the second blade portion from a first end thereof. Teeth (12') which engage with each other are formed at least at the first end and a part of the second blade portion corresponding to the first end.

(54) Refined cereal-based beverages
(57) The present invention relates 10 methods for preparing cereal-based beverages. Particularly, the present invention, provides, for example, methods for seeping and germination of cereal grain under continuous operation. The present invention also provides for wet milling of germinated cereal grains and direct transfer of the germinated grain, without drying, to the brewery for further processing. Compared to current methods the methods of the present invention significantly reduces water consumption, energy consumption and transport need.

(54) MULTIVALENT VACCINE COMPOSITION
(57) The present invention relates to stable, immunogenic combination vaccine(s) comprising a mixture of antigens for prevention and prophylaxis of infections caused by Rotavirus, Poliomyelitis virus, Haemophilus influenzae, Corynebacterium diphtheriae, Clostridium tetani, Bordetella pertussis and Hepatitis B virus. The invention particularly provides a multivalent combination vaccine comprising of i) significantly dose reduced Salk IPV or Sabin IP`V (IPV) antigens prepared by utilizing improved methods of formaldehyde inactivation and alum hydroxide adsorption resulting in maximum recovery of D-antigen and ii) Injectable heat inactivated Rotavirus antigen(s) obtained from Rotavirus (CDC-9) strains that provides a broad cross-protective immunity among human rotavirus strains, iii) Hib PRP -carrier protein conjugate having improved stability and immunogenicity wherein said Hib PRP -earner protein conjugate is initially prepared by using novel conjugation process and subsequently blended at low temperature in presence of a stabilizer for minimizing free PRP release iv) whole cell pertussis antigen with improved immunogenicity and stability obtained by addition of whole cell pertussis antigen at a later stage in a blend thereby minimizing hydrolysis based degradation v) Homogenous fractions of Diphtheria toxoid and Tetanus toxoid obtained by removal of undesirable aggregates by using Gel Permeation chromatography. The process of making such stable and immunogenic vaccine compositions by i) individually adsorbing dose reduced IPV. IRV antigens on alum hydroxide and keeping other antigen(s) unadsorbed or adsorbed on Alum Phosphate, Alum hydroxide, on a combination of Alum hydroxide and Alum phosphate and ii) using a particular order of addition of antigens during blending is also disclosed.

- (54) A beverage container having a pressure-relief device and a method of manufacturing a beverage container having a pressure-relief device
- (57) The present invention relates to a container assembly for accommodating a beverage. The container assembly comprises a collapsible beverage container having a body part for accommodating the beverage and a cylindrical neck part defining a gas-filled headspace. The container assembly further comprises a closure sealing off an opening of the cylindrical neck part. The closure comprises a closure disc, an inner cylindrical part and an outer cylindrical part. The closure disc comprises a beverage outlet for extracting the beverage. The closure further comprises a pressure-relief device located at the closure disc or the inner cylindrical part. The pressure-relief device is capable of establishing a permanent or reclosable opening through the closure or between the closure and the neck part for allowing a flow of fluid from the headspace to an external space when a pressure difference exceeds a predetermined pressure value being lower than the burst pressure of the container

- (54) HEAT MACHINE CONFIGURED FOR REALIZING HEAT CYCLES AND METHOD FOR REALIZING HEAT CYCLES BY MEANS OF SUCH HEAT MACHINE
- (57) A heat machine (121) for realizing a heat cycle, the heat machine operating with a thermal fluid and comprising a drive unit (1) provided with a first rotor (4) and a second rotor (5), each having three pistons (7a, 7b, 7c; 9a, 9b, 9c) that are slidable in an annular chamber (12), wherein the pistons delimit six variable-volume chambers (13', 13'', 13'''; 14', 14'', 14'''). The drive unit comprises a transmission configured to convert the rotary motion with respective first and second periodically variable angular velocities (ω_1 , ω_2) of said first and second rotor (4, 5), offset from each other, into a rotary motion at a constant angular velocity. The heat machine further comprises a compensation tank (44), configured to accumulate the compressed thermal fluid from the drive unit, a regenerator (42) configured to preheat the thermal fluid, a heater (41) configured to superheat the thermal fluid circulating in the serpentine coil, a burner (40), configured to supply the necessary thermal energy to the heater (41); wherein the regenerator (42), in fluid communication with the drive unit (1), is further configured to acquire energy-heat from the exhausted thermal fluid and use it to preheat the thermal fluid to be sent to the heater (41). The invention further relates to a method for realizing a heat cycle by means of said heat machine.

(54) CONTACTLESS ELEVATOR CONTROL SYSTEM
(57) The present invention provides a contactless elevator control system. The system comprises an infrared touch sensor, a relay control device and an elevator button control device, wherein: the infrared touch sensor emits an array of multiple infrared beams, receives reflected infrared beams, calculates a vertical and lateral displacement, determines a corresponding coordinate information, calculates a corresponding elevator button, and sends a corresponding control; the relay control device drives the corresponding relay contacts to close. The solution uses the touch sensor to achieve contactless control of elevator buttons, reducing the of spreading bacteria and viruses when touching the elevator buttons.
